Research approach – Method

Framework – User Centred Model

Preliminary Findings

Conclusion
All Australian Public Sector Organisations were impacted by the introduction of the Australian Digital Continuity Policy 2020, mandating the use of digital first channels for every public sector service provided [1].

This policy put considerable pressure on both public sector organisations and service users. Through exploration of previous literature, a considerable gap was identified between what is known about digital service users and non-users, and those individuals who are required to use them.

This paper will explore the barriers to digital adoption in the public sector space, specifically comparing mandatory and voluntary spaces.
The ATO was the first service provider to adopt digital first service provision, with the introduction of myTax for individuals, business portals, and tax agent portals.

The ATO has high digital adoption rates of the MyTax platform, with 95% of individuals eligible to utilise the service [2], however there are still gaps within the population that need to be explored and understood.

Progressively the myTax platform became more inclusive, through annual and ongoing adaptions, and the progressive changes in the manner in which digital adoption and service provision has occurred [3] [4].

Each iteration incorporates the feedback from users to ensure ongoing viability of the platform, while also ensuring ongoing success [5].
BACKGROUND — HEALTH ENVIRONMENT

Healthcare systems are becoming significantly more complex, with more professionals becoming involved in each individual patient's care, and ever-changing healthcare needs of the population [6].

**My Health Record** is an online platform containing a summary of an individual's key medical and health information (including histories). The site provides information for individuals and health practitioners who opted into the service to view medical histories, previous tests, medication (history and current) and diagnosis. Although there are a number of benefits from the provision of the online health record, more than 2.5 million Australians opted out of the platform [7].

**MyAgedCare** is an online platform for individuals aged 65 or older which is the starting point on an individual’s aged care journey [8]. The site provides information for government-funded services available at home to enable individuals to continue living independently.
METHOD - A QUALITATIVE APPROACH

Comparability Case Studies

Focus: To identify barriers to the use of My Health Record (a voluntary service), to understand the similarities across digital health and digital taxation, as well as mandatory and voluntary.
USER-CENTRED MODEL

- Community
- Social Norms
- Non-government Organisations

- Digital First Policies
- Legislative Compliance Requirements

- Supports
- Human Capital
- Markets

</table>
| Scams/Fraud/Security         | - Fear of scams  
- Not sure which is the real website and which is fraudulent  
- Computer/cyber security concerns                                                                 |
| No computer/Internet access  | - Have no experience utilising a computer or accessing the internet  
- Unclear on what a digital health service is  
- Have no access to the internet of computer                                                                 |
| In person                    | - Why can I not speak to someone in person?  
- Digital health means that I am not having my needs assessed through a conversation with someone and I have to provide all of my personal and private health details over a web forum |
CONCLUSION

• The preliminary findings from the digital health space in comparison to the ATO case study demonstrates significant similarities between the digital/online platforms and the issues associated with digital awareness, acceptance, assistance seeking, accessibility and support.

• Digital health services have moved too quickly in their transition from legacy to digital services.

• A transitional approach is required to educate, train and validate user’s engagement.

An important finding: the value of face-to-face or human interaction based assistance is still a necessary component of the success of eGovernment service inclusiveness.
