User Interface Development Process

Kies (1998),
Hartson (2001)

Speeding up Formative Evaluation

Heuristic Evaluation by Experts

Method Nielsen (1990,1995)

- Predefined best practice rules
- Team of (five) expert evaluators
- Rate severity of violations [0, 4]
- Overall Summary

Advantages Nielsen (1993), Noyes (1999)

- Time-efficient
- Less Human Resources
- Can be performed by novices and experts equally

Goals

Custom Heuristic Rules

- Develop a set of custom heuristics
- Focus on biomedical user group
- Compare their performance against other similar and popular heuristics

User Interface

- Support interdisciplinary research
- Allow interaction of humans and AI
- Fully functioning prototype

Existing Heuristics

Nielsen's heuristics Nielsen (1990,2005)

- 1 Simple and natural dialogue
- 2 Speak the user's language
- 3 Minimize the user's memory load
- 4 Consistency and standards
- 5 Feedback
- 6 User control and freedom
- 7 Shortcuts
- 8 Good error messages
- 9 Error prevention
- 10 Help and documentation

Human-AI interaction heuristics Amershi (2019)

- 1 Make clear what the system can do
- 2 Make clear how well the system can do what it can do
- 3 Time services based on context
- 4 Show contextually relevant information
- 5 Match relevant social norms
- 6 Mitigate social biases
- 7 Support efficient invocation
- 8 Support efficient dismissal
- 9 Support efficient correction
- 10 Scope services when in doubt
- 11 Make clear why the system did what it did
- 12 Remember recent interactions
- 13 Learn from user behavior
- 14 Update and adapt cautiously
- 15 Encourage granular feedback
- 16 Convey the consequences of user actions
- 17 Provide global controls
- 18 Notify users about changes

Biomedical AI Heuristics

Requirements

- Generalizing to new interfaces
- Adapted to the domain
- Easy to understand and apply

Approaches

- Adapting existing heuristics
- Reviewing literature of the designated domain
- Expert interviews

Biomedical AI Heuristics

Structure

- 1 Streamline main task
Lieberman (2009)
- 2 Provide full control
Amershi (2014), Gill (1996)
- 3 Orientation and Consistency
Nielsen (1990)

Interaction

- 4 Guide attention
Horvitz (1999), Sutton (2020)
- 5 Provide comparisons
Expert Interviews
- 6 Show impact
Jameson (2009)
- 7 User over system
Nielsen (1990), Horvitz (1999)

Always allow the user to correct errors by the AI efficiently and even turn off the AI completely if needed.

Presentation

- 8 Familiar language
Rzepka (2018)
- 9 Precise language
Nielsen (1990)
- 10 Familiar presentation styles
Expert Interviews
- 11 Appeal
Expert Interviews

Explainability

- 12 Explain data
De Fauw (2018)
- 13 Explain process steps
Holzinger (2017)
- 14 Explain reasoning
Holzinger (2017)
- 15 Highlight strengths and limitations
EU (2019)

NAIVE BAYES **RANDOM FOREST** K-NEAREST-NEIGHBOURS NEURAL NETWORK

1. Threshold Segmentation
Binarization Threshold: 50 on
Minimum Cell Size: 30 px on
ADVANCED SETTINGS

2. Feature Extraction
Morphological Features: Area, Perimeter, Circularity, Optical Height
ADVANCED SETTINGS

3. Random Forest Classification
Number of trees: 100
Maximum tree depth: 2
ADVANCED SETTINGS

Randomly builds an ensemble of decision trees. Each decision tree consists of layers in which the data is split into groups based on available features. Often delivers decent results.

Comparison of Usability Evaluation Methods

- Evaluate the interface with each Usability Evaluation Method (UEM)
- Conduct a baseline test to create a ground truth of usability problems
- Compare the performance using suitable metrics

Heuristic Evaluation

Nielsen's heuristics

Human-AI heuristics

Heuristic Evaluation

Biomedical-AI Heuristics

Heuristics

Predicted Problems

Nielsen's Heuristics

60

Human-AI interaction heuristics

26

Biomedical-AI heuristics

55

- Highest number of violations found by Nielsen's set of heuristics
- Experts stated that Human-AI heuristics were harder to apply

Empirical User Test

Demographics

- Discovered 75 real usability problems
- Many have already been predicted by heuristics

Lewis (1994), Hartson (2001)

Performance Comparison

Metric	Nielsen's heuristics	Human-AI heuristics	Biomedical-AI heuristics
Precision (Validity)	63.3%	73.1%	85.5%
Recall (Thoroughness)	50.1%	25.3%	62.7%
Average Severity	2.66	2.84	2.74
Weighted Recall	54.0%	28.9%	69.0%
Recall (Severity = 3)	38.9%	27.8%	77.8%
Recall (Severity = 4)	73.3%	46.7%	93.3%

Performance Comparison

Precision in %

Recall in %

Conclusion

Nielsen's heuristics

- Found most genuine problems
- Less efficient AI induced parts
- Reduced precision

Human-AI heuristics

- Worst precision and recall
- Some rules were not effective
- Difficult to apply by experts

Biomedical-AI heuristics

- Satisfying overall performance
- Uncovers most severe problems
- Best adaption to AI in this domain

Overall Remarks

- Demonstrated need for domain specific sets of heuristic rules
- Unweighted recall of 63% is helpful for further improvement
- Further evaluation on different interfaces needed

Thank You

Biomedical Research AI Heuristics

Structure

1 Streamline main task

Make the system easy to learn. Focus on the main task that a system was created for and move unimportant side tasks away from the center of attention. The presentation of the main task should be simple to not overwhelm novice users.

2 Provide full control

Provide global controls and access to important model parameters that may be adjusted to boost the system performance. Complex tasks require fine tuning and advanced users often want to make these changes on their own.

3 Orientation and Consistency

AI systems are often complex which causes users to get lost. Always show the user where he is, what is currently going on and what he can do next. Navigation and interaction items should be easily noticeable and distinguishable.

Biomedical Research AI Heuristics

Interaction

4 Guide attention

It is easy for the user to lose track what is relevant in a complex AI system. Thus, it is important to guide the user's attention to where his action is needed. Keep him focused on his task and do not throw too many alarms and notifications at him.

5 Provide comparisons

Let biomedical users compare among similar data or among parameters when they need to judge an outcome of the system or make a decision on their own.

6 Show impact

The user needs to see how his actions and decisions directly influence the system and its performance.

7 User over system

Allow the user to correct errors of the AI efficiently at all times and even turn off the AI completely if needed.

Biomedical Research AI Heuristics

Presentation

8	Familiar language	Use non-technical language if possible. Pay attention to use the correct terminology for medical concepts.
9	Precise language	Avoid ambiguous wording for labels and commands that could trigger confusion in the user regarding how to do a task or how something works.
10	Familiar presentation styles	Do not use ways of presentation for the interface that biomedical users do not know from other interfaces they work with and that they cannot interpret.
11	Appeal	AI interfaces should have an appealing and premium look. This gives the user a feeling of using a state-of-the-art, high quality and thus trustworthy product.

Biomedical Research AI Heuristics

Explain-ability

12	Explain data	The data that a task is based on needs sufficient explanation. The user has to develop an understanding of how it can be interpreted and how it is different from other data he may be familiar with.
13	Explain process steps	There needs to be a high-level explanation for the overall procedure that is performed by the system.
14	Explain reasoning	There has to be an explanation why and how the system derived a certain result or prediction.
15	Highlight strengths and limitations	Show what the strengths and weaknesses of the system are and what expectations are realistic. Highlight situations when the system may be underperforming or is in doubt.

Asymptotical User Testing

- Discovery of usability problems can be modeled as a Poisson process
- Number of detected usability problems reaches an asymptotic maximum
- Test with 21 users with a medical, biological and chemical background (7 students and 14 researchers)
- Worst Case Assumption

Interface Prototype

Human Assisted Labeling Tool

- Biomedical cell segmentation and classification
- Medical user and machine learning algorithm work hand in hand
