

Three-step Decision Framework for Planning Software Releases

José del Sagrado , Isabel M. del Águila, and Alfonso Bosch
Dpt. Informatics. University of Almería (Spain)

Speaker: Alfonso Bosch – abosch@ual.es

Alfonso Bosch - Profile

Lecturer at Informatics Dept. in the University of Almería since 1988.

Topics: Database Administration, Intelligent Systems, Business Intelligence, Data Viz

Research Group: Data, Knowledge & Software Engineering

Research Activity: Artificial Intelligence & Information Systems, applied to real problems (agriculture, energetic efficiency, software engineering).

Results: software systems for greenhouse design, decision support systems for intensive cultivations and olive grove. (registered at intellectual property office).

Scientific Production: Above 60 contributions, including international and national magazines and workshops.

Actual Projects: Renewal of Software Based Software Engineering Spanish Network.

Management Positions: Vice principal of the Politechnical Engineering School, Director of the Teaching Organization Secretariat, Secretary of the Politechnical Engineering School and Coordinator of the Degree in Computer Engineering

Index

- **1. Introduction**
- 2. Software Release Planning Framework
- 3. Case Study
- 4. Appraisal of the Framework
- 5. Conclusions and Future Work

I. Introduction

- Systems are large and complex, with interconnections to similar applications
- Worldwide development: software developers, designers, testers, project managers, and users
- Requirement Engineering needs to be dynamic and collaborative (selecting in/out requirements)
 - Decision Support Tasks based on risks, costs and benefits
 - Timelines, Dependencies and Constraints
- Assessment made by implied stakeholders
- ¿What is the best solution?

I. Introduction

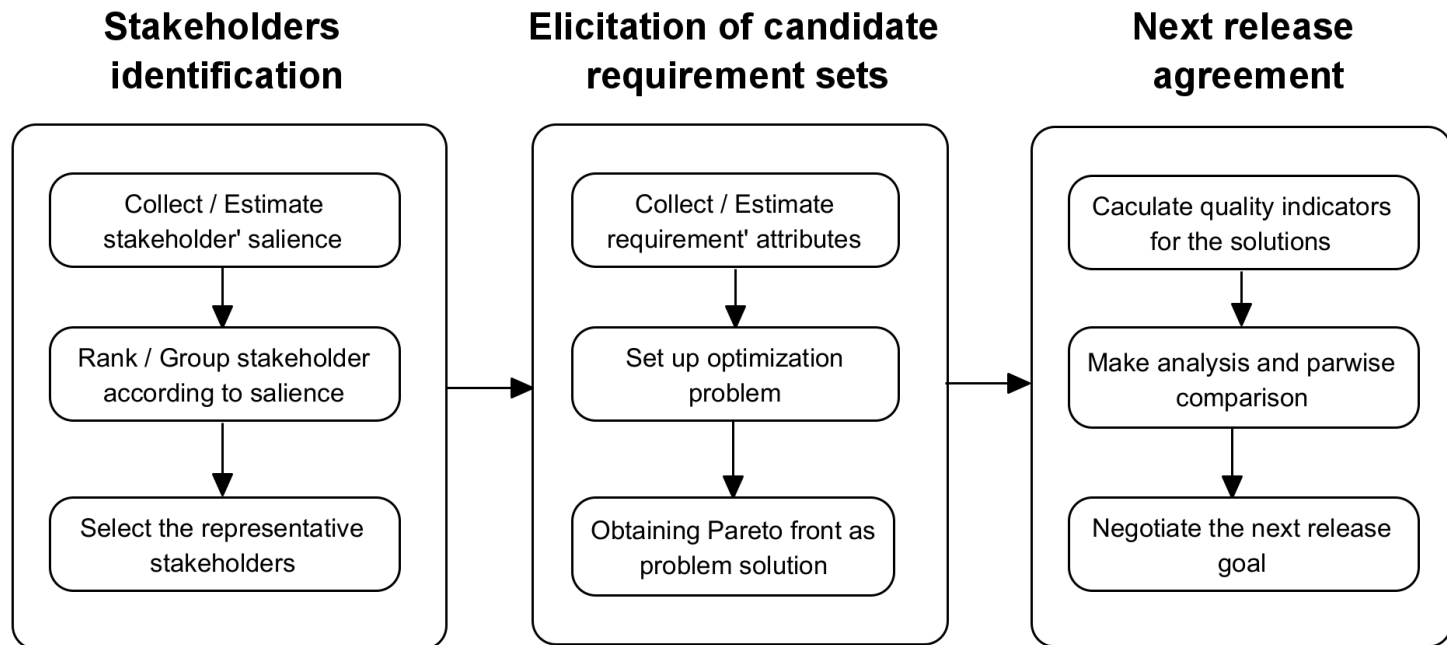

- Three questions
 - Who assesses the attributes of the requirements?
 - What is the best set of requirements?
 - Do we have an agreement to build the release?
- Three separate processes framework:
 - stakeholder identification
 - elicitation of candidate requirement sets
 - next release
- Architecture proposal -> Case Study
- Discussion of limitations and scope

Index

- 1. Introduction
- **2. Software Release Planning Framework**
- 3. Case Study
- 4. Appraisal of the Framework
- 5. Conclusions and Future Work

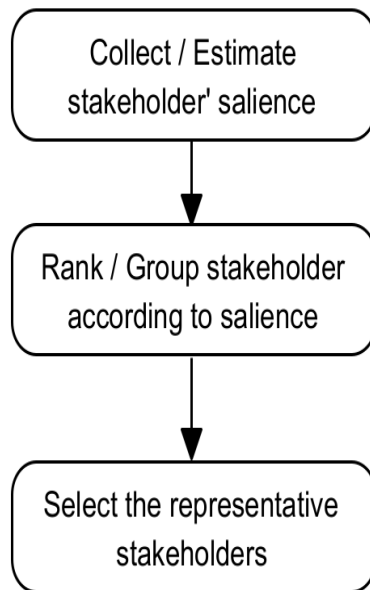

2. Software Release Planning Framework

Workflow division into three independent and connected stages

2. Software Release Planning Framework

Stakeholder Identification

Stakeholder Candidate Set $Stk = \{sk_1, sk_2, \dots, sk_q\}$

Salience: power, legitimacy and urgency (interviews)

w_{pij} , w_{lij} , w_{uij} : values given by interviewee i to sk_j

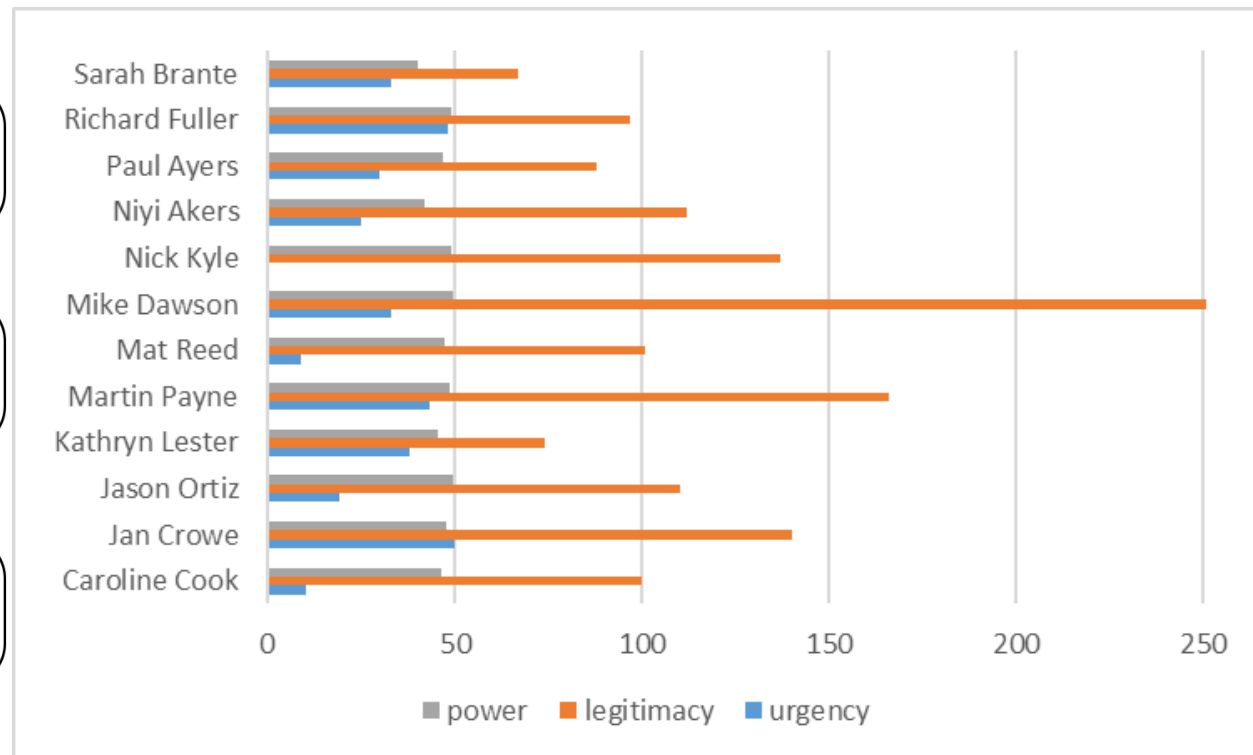

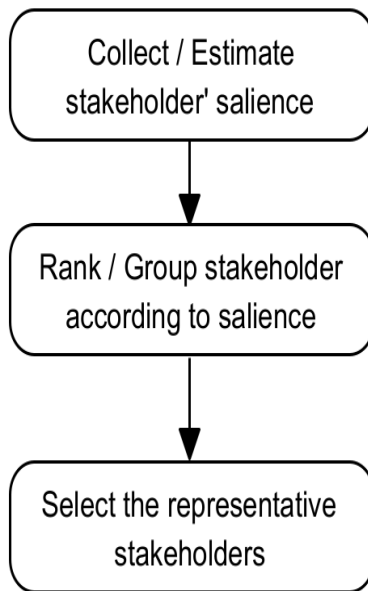

$$p_j = \sum_{i=1}^h w_{pij},$$
$$l_j = \sum_{i=1}^k w_{lij},$$
$$u_j = \sum_{i=1}^q w_{uij}.$$

Different strategies to select the most influential:
clustering or weighting

Result: set of m stakeholders allowed to
propose the requirements

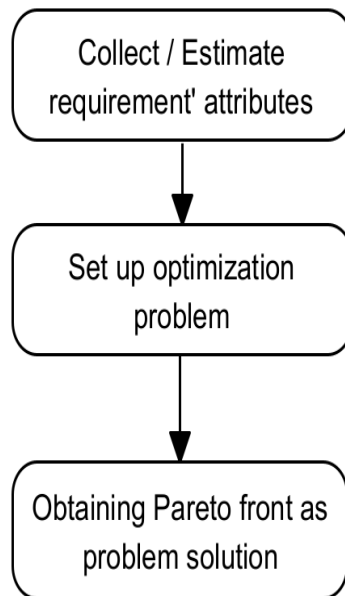

2. Software Release Planning Framework

Stakeholder Identification

2. Software Release Planning Framework

Elicitation of Candidate Requirement Sets

Candidate Requirements $R = \{r_1, r_2, \dots, r_n\}$

v_{ij} : subjective value assigned by stakeholder sk_i to r_j

$W = \{w_1, w_2, \dots, w_m\}$ stakeholder weight (importance)

For $r_j \in R$, its satisfaction s_j is:
$$s_j = \sum_{i=1}^m w_i * v_{ij}$$

Effort for developing r_j $E = \{e_1, e_2, \dots, e_n\}$

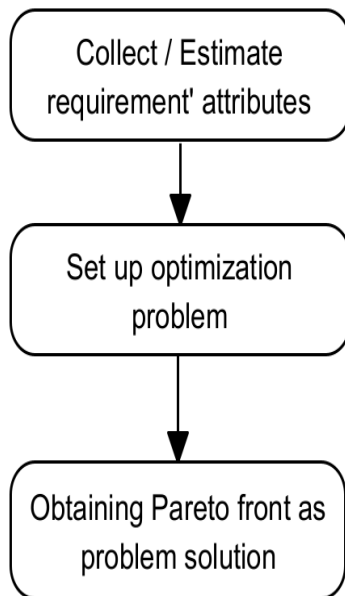

Cost limit (amount of resources): B

Optimization problem: Find U , candidate requirement sets to be included in next release using Pareto dominance

$$\begin{aligned} & \max \sum_{j \in U} s_j, \\ & \min \sum_{j \in U} e_j, \\ & \text{subject to } \sum_{j \in U} e_j \leq B \end{aligned}$$

2. Software Release Planning Framework

Elicitation of Candidate Requirement Sets

Alternative formulation: Constraints on implementation order

- Implication, (r_i implies r_j)
- Combination interaction, (r_i combined with r_j),
- Exclusion interaction. (r_i excludes r_j)

Downsizing result set

Optimization algorithm: Obtain Pareto optimal solutions

Candidate Requirement Sets

Best Requirement Set

2. Software Release Planning Framework

Next Release Agreement

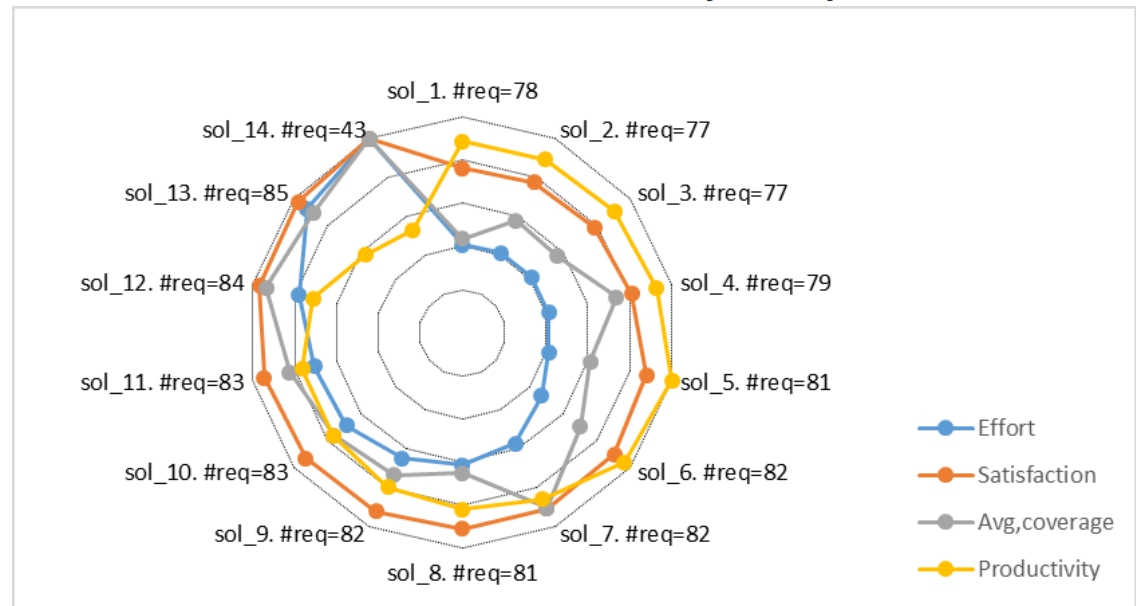

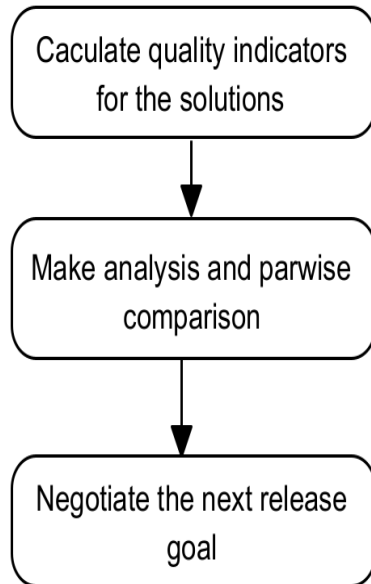

Choose the set of requirements to be implemented

Quality indicators: Visual aids to guide decision makers

Let $U \subseteq R$: solutions under analysis

Productivity: $\text{prod}(U) = \text{sat}(U)/\text{eff}(U)$

Coverage: $\text{stcov}_i(U) = \sum_{j \in U} v_{ij} / \sum_{j \in R} v_{ij}$

Index

- 1. Introduction
- 2. Software Release Planning Framework
- **3. Case Study**
- 4. Appraisal of the Framework
- 5. Conclusions and Future Work

3. Case Study

Dataset: Replacement Access, Library and ID Card project (RALIC)

Combine Access control systems at University College London (UCL)

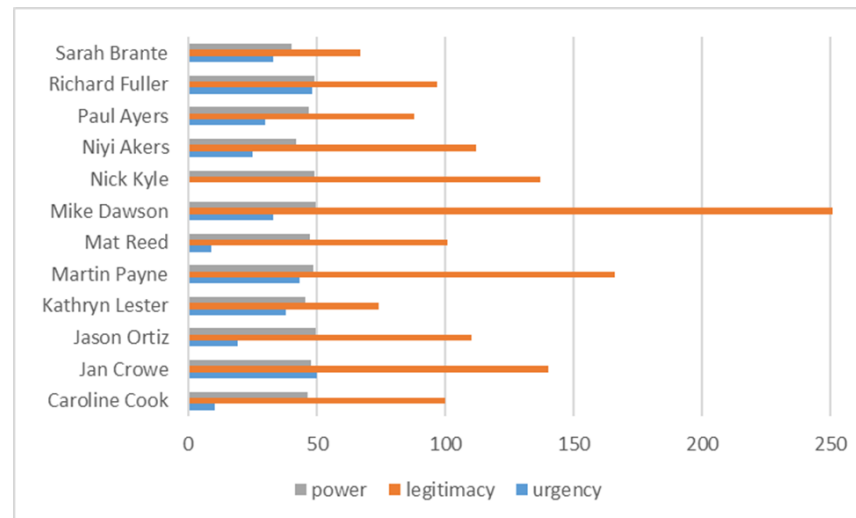

RALIC Stakeholders Identification
Recommendations Network → 144 stakeholders

138 requirements: 10 objectives, 48 requirements, 104 specific requirements

Effort: 4 to 7000 persons-hour

75 RALIC stakeholders use the 100-point method → 83 requirements left
No interactions

Relevant Stakeholders Identification: Clustering → 12 stakeholders left

3. Case Study

RALIC Elicitation of Candidate Requirement Sets

From Stk, R and E
and Satisfaction

Optimisation Problem

$$\begin{array}{l} \max \sum_{j \in U} s_j, \\ \min \sum_{j \in U} e_j, \\ \text{subject to } B_1 \leq \sum_{j \in U} e_j \leq B_2 \end{array}$$

B_1 : 20%, B_2 : 25%
From total effort

Resource limit interval: No upper resource limit
Discard solutions with lower effort

For RALIC, $B_1=12473.3$, $B_2=13304.8$

Pareto front: Greedy Algorithm

For each effort value in the range $[B_1, B_2]$

Find solution with max number of requirements

Iterate replacing requirement with valid effort limit

Check dominance and relace if it's higher

Simple and produces a Pareto front (not exhaustive)

3. Case Study

RALIC Elicitation of Candidate Requirement Sets

Satisfaction

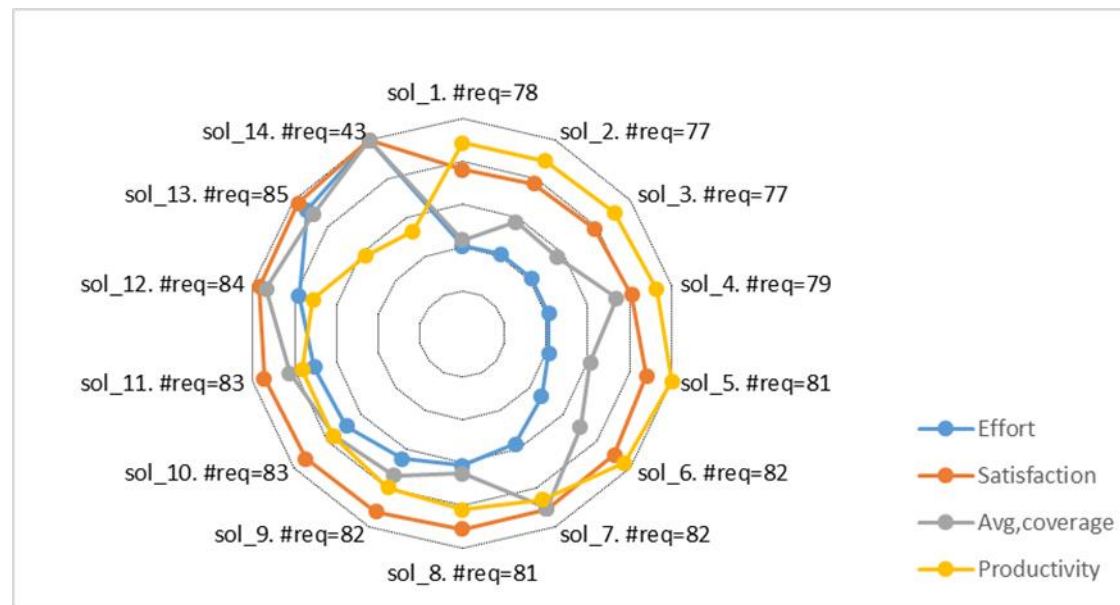

Pareto Front

Effort (hours/person)

3. Case Study

RALIC Next Release Agreement

Visual Indicators Coverage

Best candidate solutions seems 13 or 14
(Not for Productivity)

Human process: Pairwise comparisons (ex. 12 and 7)

Other factors (non quantitative): Risk -> Better 7

Index

- 1. Introduction
- 2. Software Release Planning Framework
- 3. Case Study
- **4. Appraisal of the Framework**
- 5. Conclusions and Future Work

4. Appraisal of the Framework

Previous strategies: three separate tasks

- Best requirements set: optimization problem

- Do not work in identification and prioritization

Stakeholders identification

- Manually (experience & intuition)

- Systematic (consistent, precise and complete result)

- Do not have a requirement selection stage

Solution Selection in Pareto front: Complex techniques

The three stages have not been in a unique framework

Index

- 1. Introduction
- 2. Software Release Planning Framework
- 3. Case Study
- 4. Appraisal of the Framework
- **5. Conclusion and Future Work**

5. Conclusion and Future Work

Linking three complex software engineering problems
Global view of defining the next release goal

Framework provides a pragmatic approach

Stages Stakeholder Identification
 Elicitation of Candidate Requirement Sets
 Next Release Agreement

Manage and improve tools/algorithms for each one
Improve the whole process

Validity: Application to a real problem (RALIC)

Future work: Application to other software projects with data
Investigate the impact on the solutions in NRP

**Thank you
very much**
