Date: May 20, 2025

Outline

1 Introduction

2 Challenge

3 Our Method

4 Results & Discussion

5 Conclusion

Introduction

Introduction to CBCT Technology

- An advanced imaging technique in dentistry

Introduction to CBCT Technology

Introduction to CBCT Technology

- Implant placement and surgery planning using CBCT images

Challenge

Challenge

What is the main challenge?

High radiation exposure
for high-quality images

Higher risk of radiation-
induced cancers

Industry Solution

Reduce radiation
exposure for patient
safety

lower visual
quality, and
limited resolution

How can we enhance the
spatial resolution of low-
dose CBCT images?

➤ ~~Single-image super-resolution methods~~ **too simplistic**

➤ **Multi-image super-resolution methods** ✓

Inter-slice &
intra-slice
information

3D CBCT Volume

- No real-world paired CBCT dataset for training the neural networks

Not fully paired

Our Method

Our Method

- Leveraging both inter-slice and intra-slice information for resolution enhancement

Our Method

Results of our comparative analysis of existing Single-Image Super-Resolution (SISR) & Stereo-Image Super-Resolution (SSR) methods

Zero-shot learning strategy applied to pretrained networks

	Method	#S	#Params	PSNR	SSIM
SISR {	SwinIR	x2	11.28M	36.32	0.9849
	NAFSSR-T	x2	0.45M	36.72	0.9865
	NAFSSR-S	x2	1.54M	36.65	0.9859
SSR {	NAFSSR-B	x2	6.77M	36.47	0.9857
	NAFSSR-L	x2	23.79M	36.08	0.9846
	StereoMamba	x2	7.55M	35.88	0.9840

→ The most promising architecture
But worst generalizability

Our Method

Results of our comparative analysis of existing Single-Image Super-Resolution (SISR) & Stereo-Image Super-Resolution (SSR) methods

Zero-shot learning strategy applied to pretrained networks

Why does StereoMamba have the worst generalizability?

CBCT image with simple texture
and structures

Forcing large, complex models to overfit to dataset-specific details and amplify noise

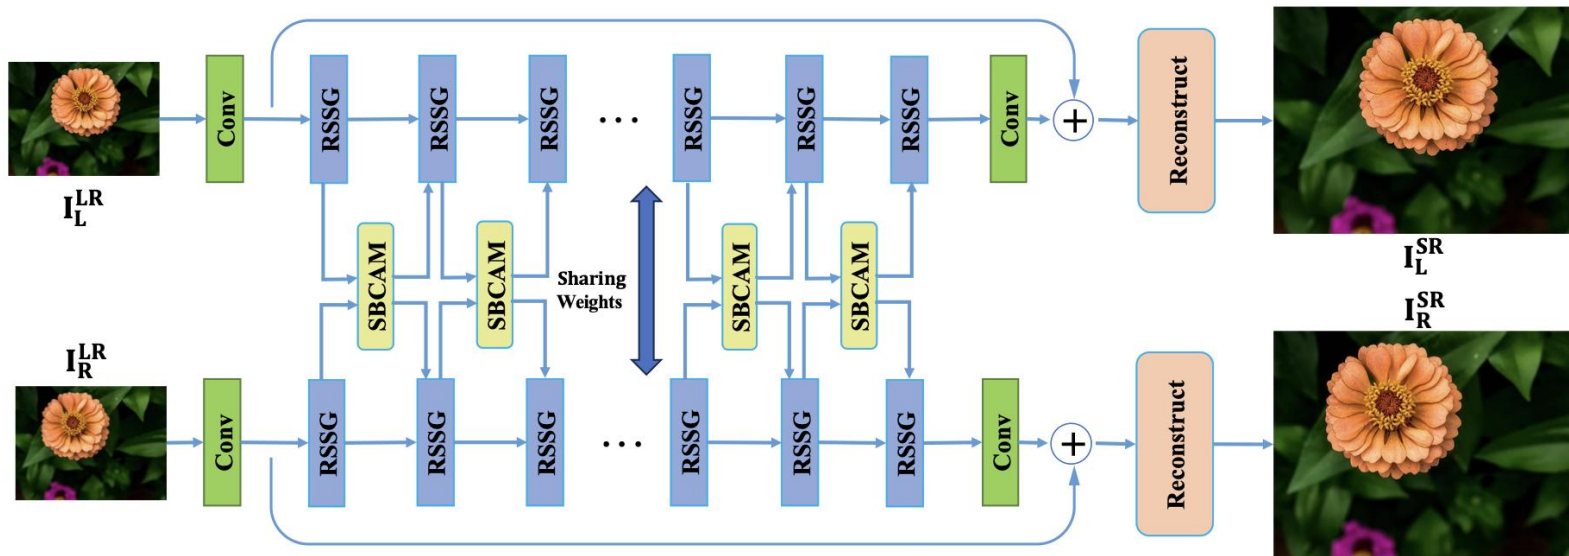

Our Method

Complexity reduction
in StereoMamba

A lightweight version without
memorizing dataset-specific details

More robust
feature extraction

Original StereoMamba:

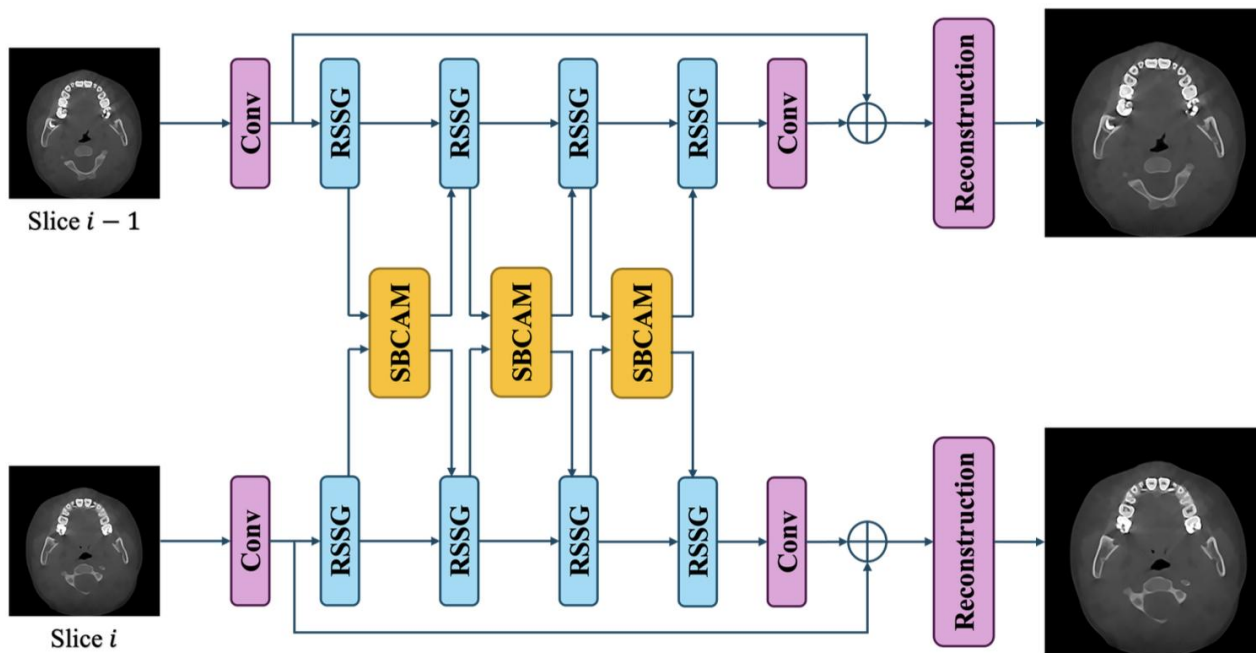

Complexity reduction
in StereoMamba

A lightweight version without
memorizing dataset-specific details

More robust
feature extraction

StereoMamba-Light:

Results & Discussion

Results & Discussion

StereoMamba-Light outperforms all existing SISR and SSR methods.

lighter models are more robust to domain shifts from RGB to grayscale CBCT images

Avoid overfitting by focusing on fundamental spatial features rather than dataset-specific variations

	Method	#S	#Params	PSNR	SSIM
SISR	SwinIR	x2	11.28M	36.32	0.9849
	NAFSSR-T	x2	0.45M	36.72	0.9865
	NAFSSR-S	x2	1.54M	36.65	0.9859
SSR	NAFSSR-B	x2	6.77M	36.47	0.9857
	NAFSSR-L	x2	23.79M	36.08	0.9846
	StereoMamba	x2	7.55M	35.88	0.9840
	StereoMamba-Light	x2	0.9M	38.03	0.9886

Thank you for listening!
